Why Care About Conductivity?

- Aquatic habitat degradation linked to conductivity
 - Is it the ions or salinity?
- Moving towards conductivity regulation
 - EPA has proposed limits
 - **300 $\mu\text{S}/\text{cm}$** in Appalachia

Current Approaches...

- Adsorbents
- Desalination
- Ion exchange
- Chemical precipitation
- Membrane filtration
 - Reverse osmosis

Reverse Osmosis Membrane Element inside a Pressure Vessel

A Role for Passive Treatment?

- The scope of passive treatment has continually broadened since its inception
 - Treatment wetlands
 - OLCs
 - ALDs
 - SAPS
 - Bioreactors
 - Co-treatment
 - ???

Passive Possibilities

- 1) Dilution by rain, runoff or groundwater influx

- 2) Adsorption to particles or surfaces

particle

- 3) Oxic metal hydrolysis & precipitation

- 4) Sulfate reduction

- 5) Anoxic metal sulfide formation & precipitation

- 6) Neutralization by HCO_3^- with CO_2 offgassing

Passive Possibilities

- 1) Dilution by rain, runoff or groundwater influx

- 2) Adsorption to particles or surfaces

particle

- 3) Oxic metal hydrolysis & precipitation

However, no analysis exists in the literature

Overview

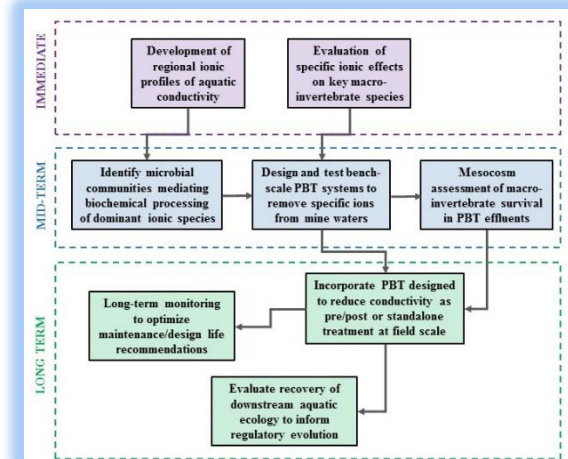

Background

Methods

Results

Interpretation

Methodology

- Defined “passive biological treatment” as systems with a significant biotic component
- Literature search for:
 - Wetlands
 - Oxidation ponds
 - Vertical flow bioreactors (i.e., RAPS, SAPS, etc.)

Methodology

- Peer-reviewed journals
 - Google Scholar & WorldCat
- Proceedings
 - IMWA
 - WVMDF
 - ASSMR & ASMR

Hoping for “extraneous” data!

Overview

Background

Methods

Results

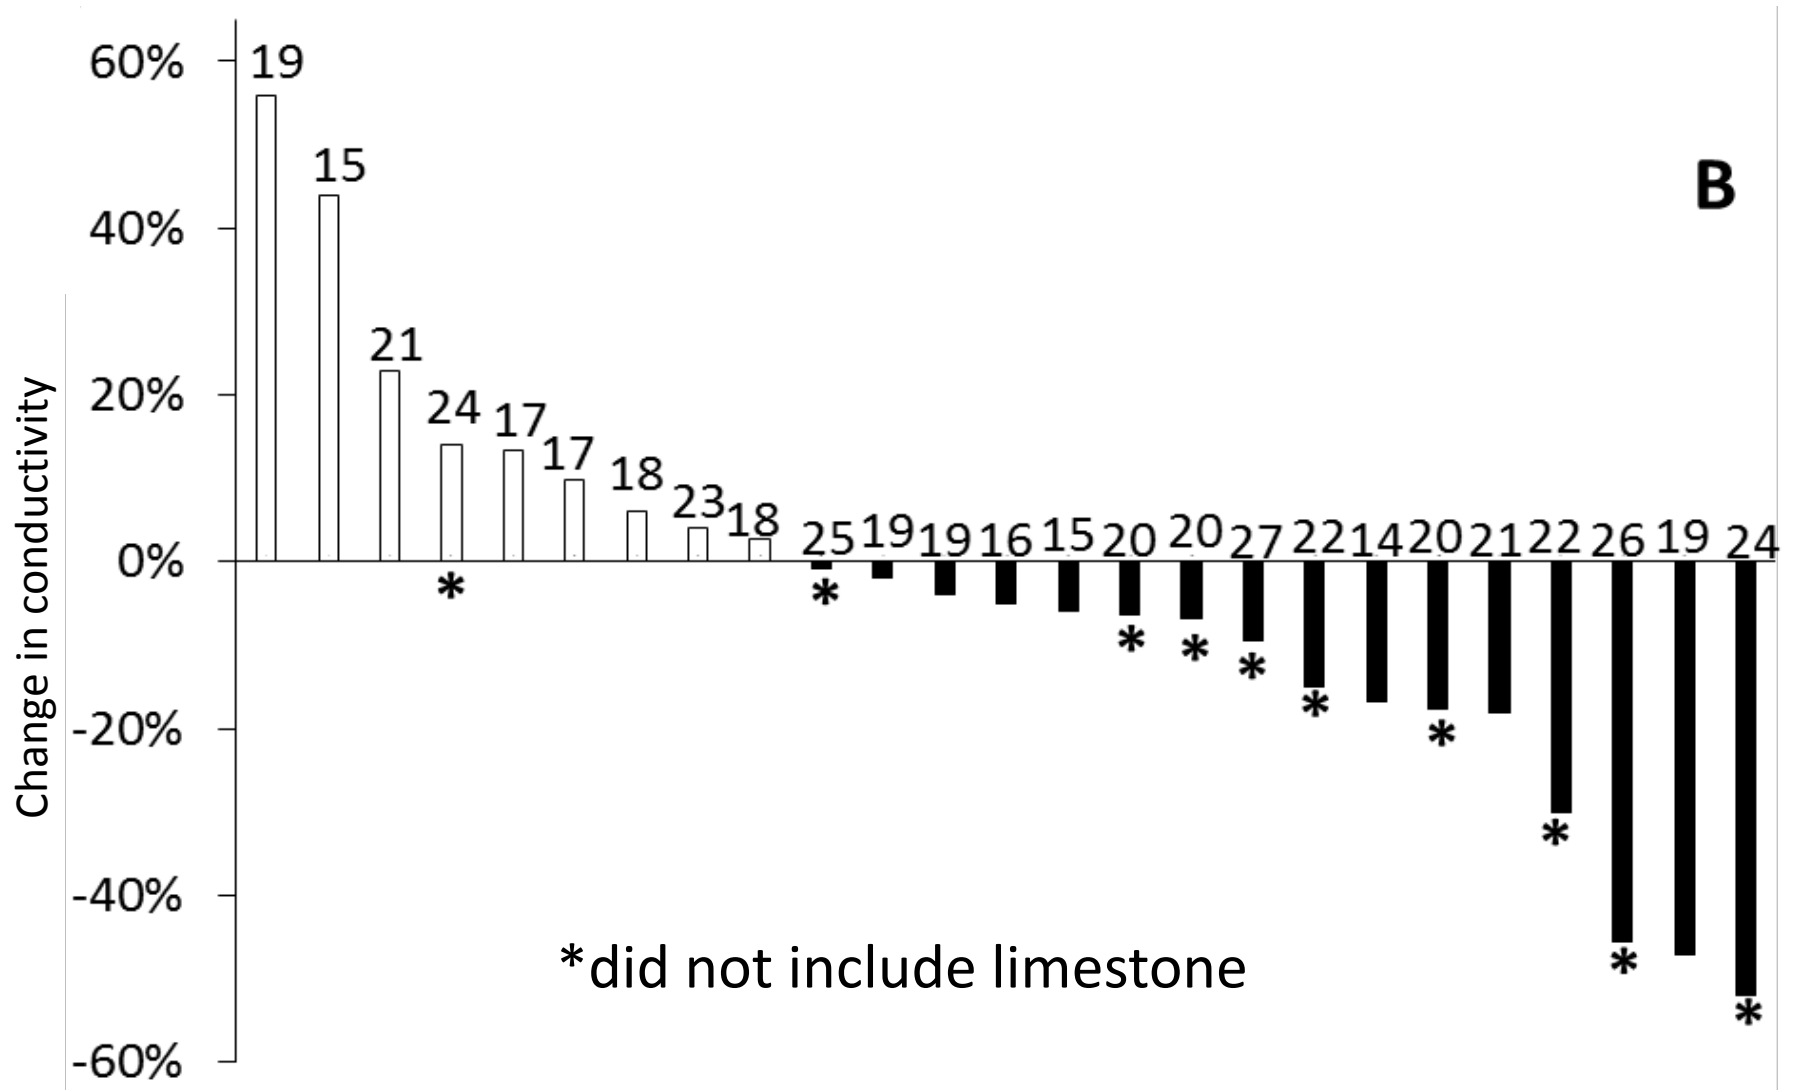

Future Work

Results

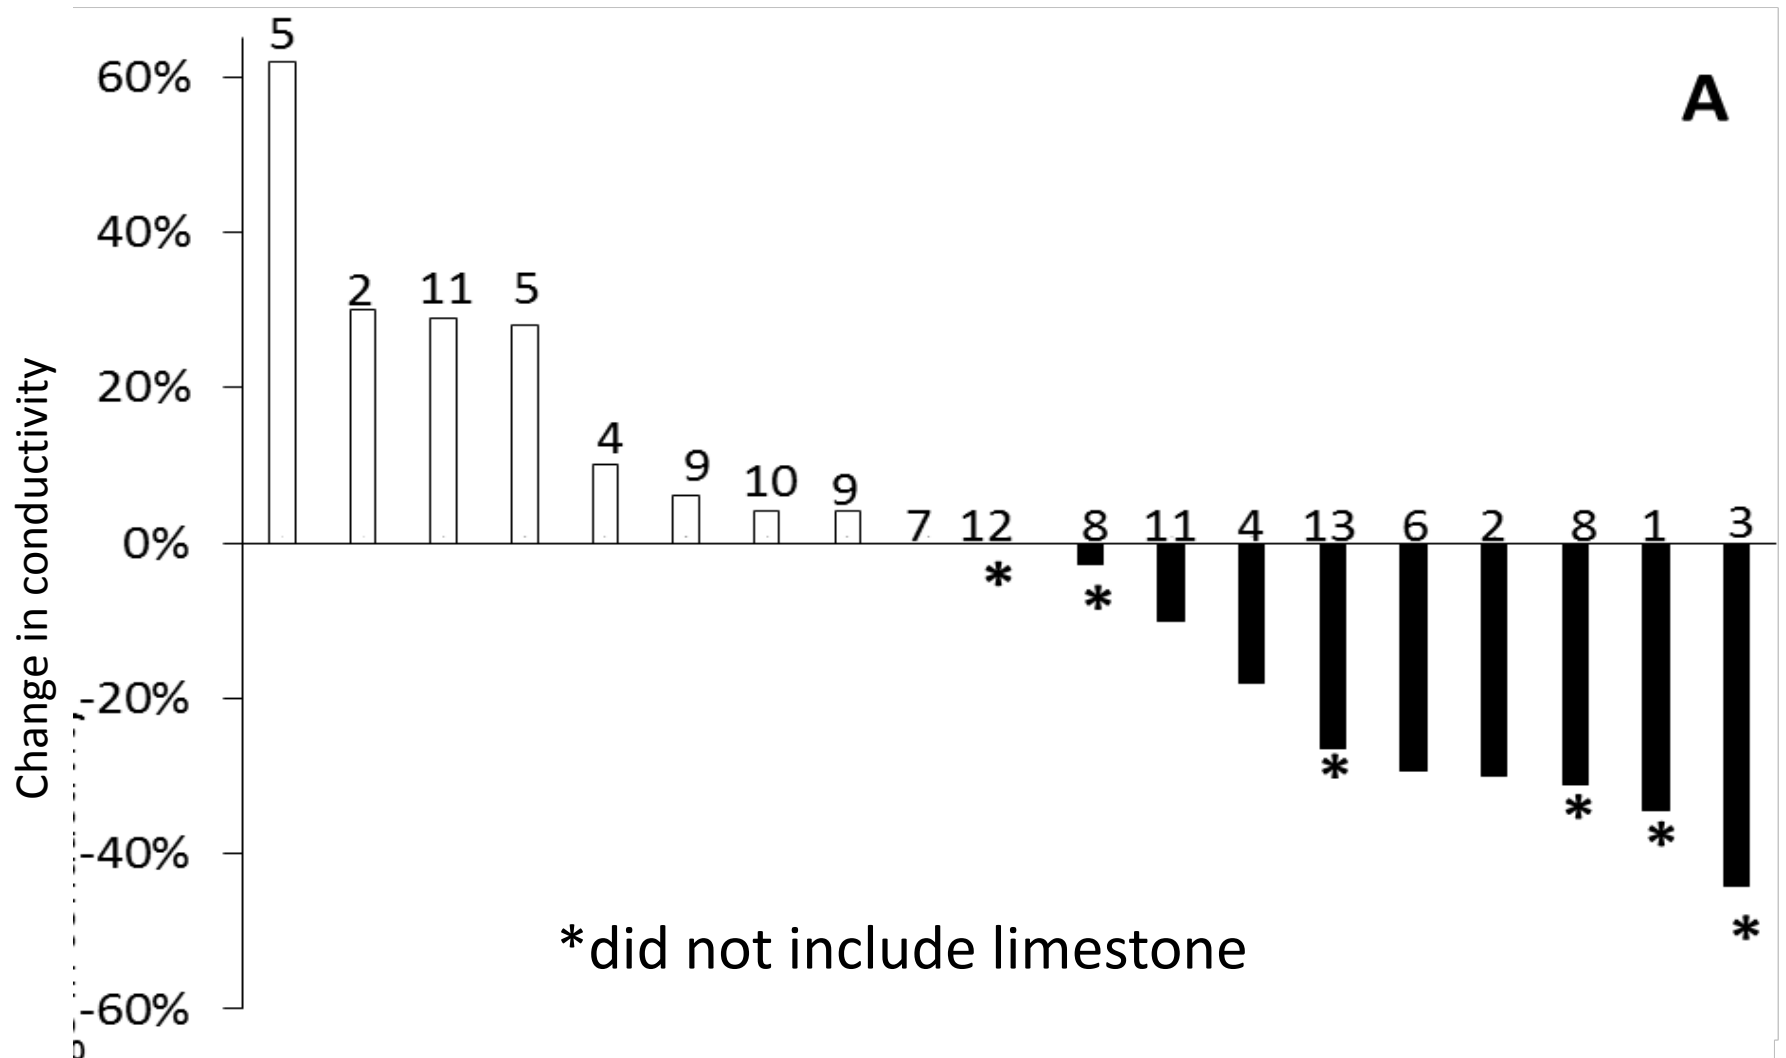

- 9 publications in peer-reviewed journals
- 18 studies in conference proceedings
 - Some with multiple systems

“Wetlands / Ponds”

“Vertical Flow Bioreactors”

Sulfate Reduction

- Theory matching results
 - 27-37% decrease in conductivity possible with typical AMD
 - Replacing all sulfate with bicarbonate
 - Further reduction possible with metals to form metals sulfides
 - Up to 44% decrease noted

Limestone

- Limestone-free reduced conductivity better
 - Only 1 of 16 systems without limestone caused increase in conductivity
 - 4 of 5 top conductivity reducers were limestone free

Overview

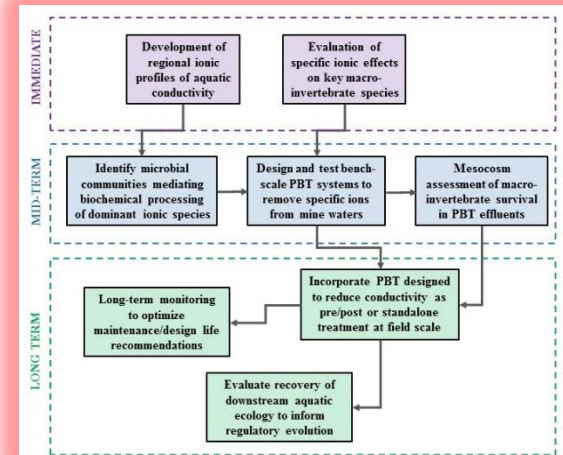

Background

Results

Methods

Future Work

Design Challenges

- Sulfate reduction is primary possibility
 - However 30-40% decrease in conductivity is max predicted by stoichiometry
 - And max noted in our review
- How to maximize for conductivity removal without losing critical metal treatment?

Issues and Challenges

- Low pH drainage may be better fit
 - Bicarbonate reaction with H^+
- Net alkaline drainage may be more difficult
- Seasonality
- Discharge sources

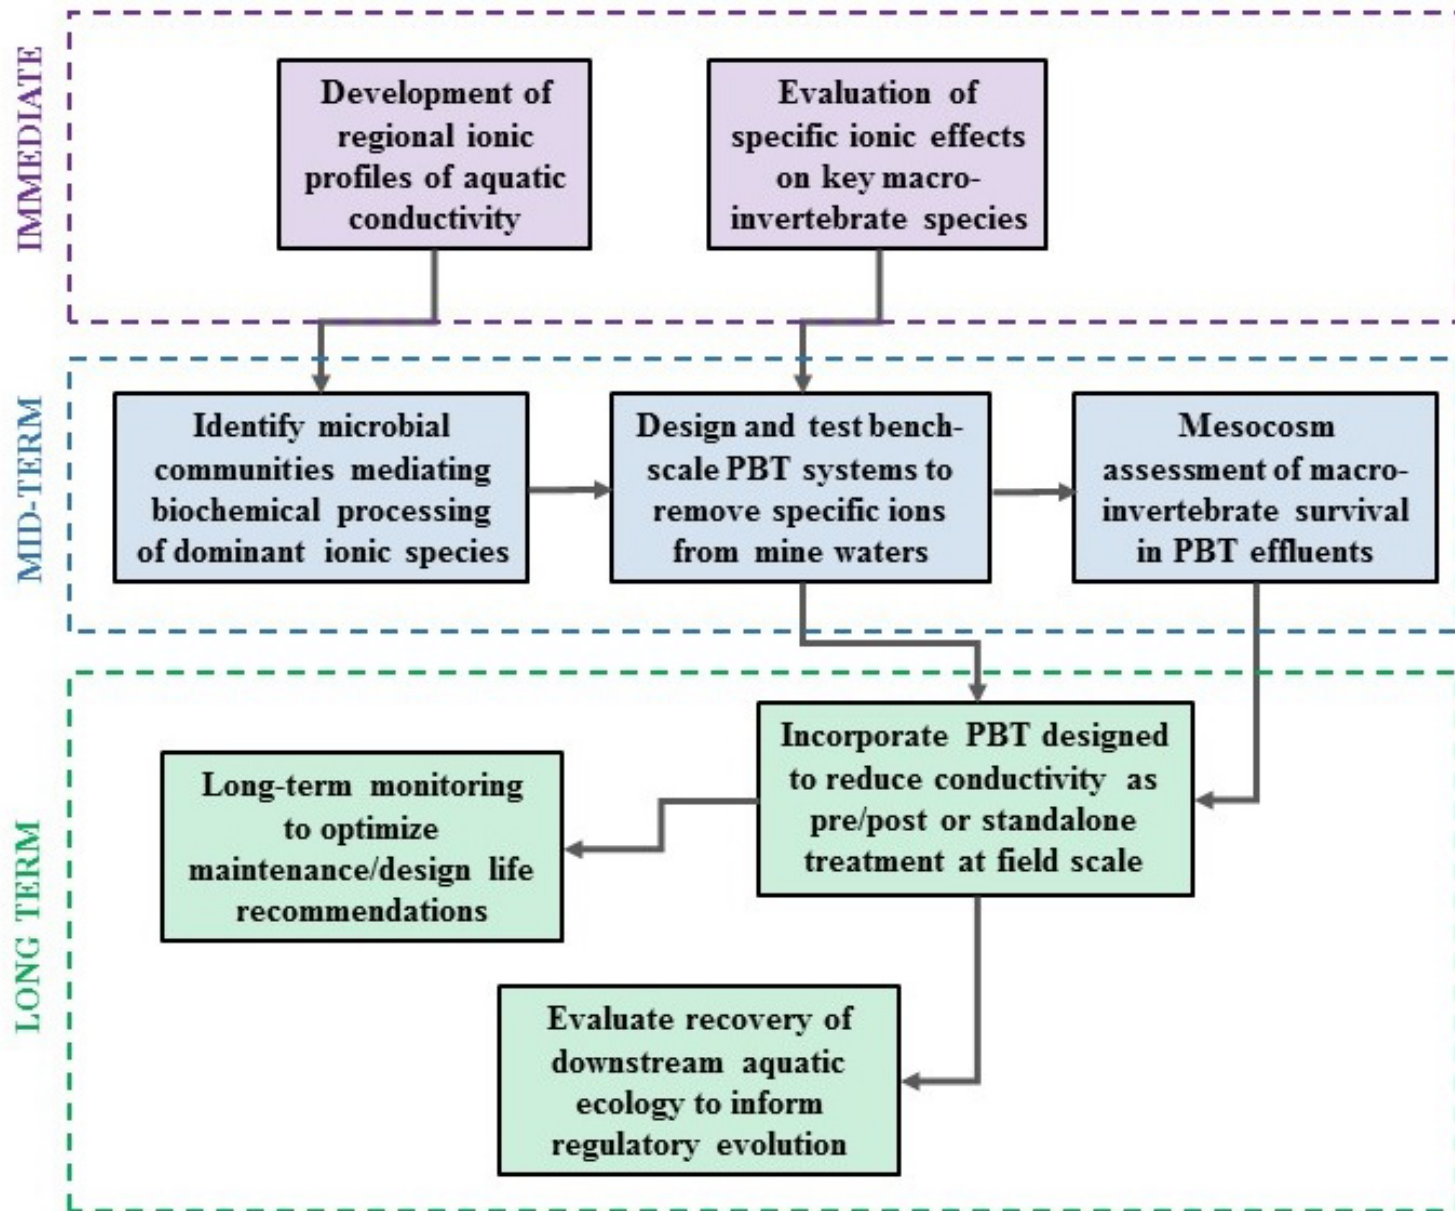

Is it Really Conductivity?

- SC/ sulfate correlation has been noted...but...
 - Elevated conductivity persists but metals are in sediments
 - “islands” of reaches with good water quality, high conductivity, but low richness/diversity
 - Impacts of unsteady treatment
 - Years to rebound

Issues with Regulating Conductivity

- The toxicity of ions is not equal
- Regional baseline conductivity profiles are quite variable
- Competitive inhibition (e.g. Ca^{2+} vs. Zn^{2+})

Future Work
